Primary Examiner, AU 1715 U.S. Patent and Trademark Office

/JOEL G HORNING/

Examiner, Art Unit 1712

Continuation of 11. does NOT place the application in condition for allowance because: On page 4, applicant argues that Jersch does not teach utilizing the FOLANT technique to decompose a vapor in CVD, so it would not be obvious to use FOLANT for that purpose. However, the basis for the rejection was that FOLANT is a known method to intensify light, so it would be obvious to use it for that purpose, even if the resulting light is used to heat a vapor so it decomposes instead of heating a surface so it changes shape. Applicant has not provided evidence as to why such a substitution would be non-obvious or would be expected to produce unpredictable results.

Regarding applicant's argument that "wherein' in claim 10 distinctly means "at the probe tip", so that the claim requires that the light of the beam "at the probe tip" is not of sufficient intensity to decompose the vapor. The examiner disagrees, the term "wherein' simply further details how the process step occurs, not any specific subregion of the apparatus. That is, it just means: during the process, an intensity of the light beam is not enough to decompose the vapour. For this limitation to NOT be met would then require the everywhere (even outside the chamber, if the III the process, and intensity of the light that the III that the process of the process of the III that the process of the III that the process of the III that I
